

A quiet Debian host for cloud nodes and bare metal.

Small by default. Signed when it boots. Able to speak, if you ask it to, before it asks you anything. Designed from the start for blind and low-vision operators: speech, braille, and large print at the boot console.

01

Debian, held still

Packages come from Debian stable. An update is a new signed image, and the previous one still boots.

02

A shell when it is sick

A default set small enough to read on one screen. Root stays available for a person who has to see why a node failed.

03

Speech before questions

Five numbered boot entries. Speech starts after the kernel, so a blind operator can answer the install prompts.

Two prompts, then it builds.

1 Say the hostname →

```
blunix: hostname  
ada.blx.io. Say yes to  
keep it.
```

It reads the name back and waits. Silence does not fetch.

2 Type the key →

```
blunix: key
```

Echo is off. Never spoken, never sent to the server. The file decrypts on the box.

→ 3 It builds

Disk, network, access profile, pinned tools. Unknown fields and shell scripts are refused.

TLS proves the hostname is ours. The key proves the file is yours.
